We need to adjust the 15 and 0 so the difference drops by 8 (the difference of 7 is 15-8). Half of that drop: 4 (8/2 =4) tells us how much to subtract from the greatest possible value (15) and add to the smallest greatest value (0) to decrease the difference between the 2 numbers by 8. Instead of 15 and 0, we now have 11 and 4.

difference between R square and rmse in linear regression

Mar 18, 2015 · Both indicate the goodness of the fit. R-squared is conveniently scaled between 0 and 1, whereas RMSE is not scaled to any particular values. This can be good or bad; obviously R-squared can be more easily interpreted, but with RMSE we explicitly know how much our predictions deviate, on average, from the actual values in the dataset.
