Electromyogram and nerve conduction studies (emg/ncs): These tests measure the electrical impulse along nerve roots, peripheral nerves and muscle tissue. This will indicate whether there is ongoing nerve damage, if the nerves are in a state of healing from a past injury or whether there is another site of nerve compression. Additional tests, including ultrasound, electromyography, and nerve conduction studies can be performed to confirm diagnosis and help determine the location and extent of nerve damage. Many veterans suffer from various service connected back conditions, which can affect your upper back, middle back, and/or lower back. The accumulation of these sugars cause a reduction in the synthesis of products required for normal nerve conduction and function. The chemical conversion of glucose will also increase the oxidative stress on nerve cells and lead to further ischaemia and thus causing further nerve cell injury and death. Lateral geniculate nucleus - Wikipedia
The lateral geniculate nucleus (LGN; also called the lateral geniculate body or lateral geniculate complex) is a relay center in the thalamus for the visual pathway. It is a small, ovoid, ventral projection of the thalamus where the thalamus connects with the optic nerve. There are two LGNs, one on the left and another on the right side of the thalamus.
